

Elder Mind

Agentic Governance

by Cyber Elders

Quick Start

From zero to your first blocked action in three steps.

Not technical? Ask your AI assistant to do steps 1–3 for you and explain each one.

1 · Install & wire it into your agent

```
pipx install . # from source (pre-release)
eldermind init claude-code
```

2 · See it work — try a dangerous command

```
echo '{"action":"bash","target":"git push --force origin main"}' | eldermind check
```

■ **block** · risk 16/25 (elevated_review) · OWASP ASI02 Tool Misuse · decision EM-2169fd82a466

3 · Inspect the evidence

```
eldermind verify # audit chain intact
eldermind summary # how many high-risk calls were stopped
```

That's it — every risky action is now checked, explained, logged, and governed locally. Turn on supply-chain protection during `init` to also catch known-compromised package installs.

Govern the action. Teach the operator. Keep it local.
